

# “Keeping your glasses beautiful.”

## CARE TIPS FROM THE MASTER

### MICROFIBRE CLEANING CLOTH

For daily cleaning, we recommend cleaning with the microfibre cloth supplied. This can be washed at 40 degrees but please do not use fabric softener.

### SOAP + WATER

The best way to clean your glasses is with a little soap and warm water. Then carefully rub them dry with a microfibre cloth.

### CAUTION

It's best to keep your glasses in a glasses case when you're not wearing them as this protects them from accidental bending and minor scratches. Avoid extreme temperature fluctuations (saunas, windscreens) as these damage the glasses and the anti-reflective layer of the lenses.

### SOAP + WATER

Buffalo horn frames can become a little dull over time. A natural patina forms on the frames. Make sure no dust particles are on the lenses when you clean them to avoid scratching the plastic lenses. Only clean with water when necessary. When rinsed with water, the smoothed fibres in the horn dissolve and the frame turns matt more quickly than normal. The horn glasses can be treated once a week with hand cream to prolong their lifetime.

### WOODEN GLASSES

Wood and water do not mix well. If possible, wooden glasses should only be cleaned with a microfibre cloth. Make sure there are no dust particles on the lens when cleaning, otherwise your plastic lenses could easily get microscopic scratches. If you clean your wooden glasses with water, make sure to dry them extremely well. Under no circumstances should wooden glasses be cleaned with strong cleaning agents or solvents.

### PLASTIC & METAL GLASSES

Plastic and metal glasses are very easy to take care of and can be easily cleaned with soap and water as well as with a microfibre cloth. Never use tissues, toilet paper or kitchen paper to clean your glasses, they leave behind additional microparticles that can leave scratch marks on your glasses.
